NAVAL POSTGRADUATE SCHOOL
Monterey, California

Rear Admiral J. J. Ekelund
Superintendent

D. A. Schrady
Acting Provost

The work reported herein was carried out for the Naval Postgraduate School by Dr. Oded Amichai under Contract Number N00228-81-C-H231. The work presented in this report is in support of the DARPA/AIFS project. The work is a continuation of earlier research efforts by several thesis students. An age-old problem is the conflict between optical quality and aerodynamic performance for infrared domes. The research may provide a means to circumvent the problem through use of gradient refractive index. The project on Navy Applications of AIFS is funded by Defense Advanced Research Projects Agency and is under the cognizance of Professor A. E. Fuhs.

20. ABSTRACT CONTINUED:
designing a GRIN lens and for determining aberrations has been developed. A different program (LENS) calculates lens design and lens performance for the case of homogeneous refractive index. Results of this program provide a check on the more complex program which includes GRIN. The computed program calculates the spot diagram for both meridianal and skew rays. The spot diagram, which is the intersection of rays with the focal plane, is plotted, and the σ_{rms} and centroid location of the spot diagram are calculated. Also a cumulative energy diagram is obtained from the program. The computer code has been organized to calculate the items enumerated above for either a circular cone for the inside or outside surface of the pointed lens. For homogeneous refractive index, both cases are included in the program discussed in this report. However, for the GRIN case, only the complete program for a lens with a conical surface on the outside is reported here. The alternate case is being developed by a thesis student.

Features of the computer program include the following: use of many subroutines for clarity and for easy modification, and use of program structure for easy integration into an optimization code.

Sample lens designs and lens performance are presented. The computer code provides the tools for lens design. Considerable additional work is needed for selecting the best lens design.

ABSTRACT

For infrared sensors located at the nose of a missile or a projectile, an age-old problem occurs. A conflict between optical quality and aerodynamic drag exists. A new approach for solving this problem is being developed using gradient refractive index, GRIN, for lens design. The equations for lens design incorporating GRIN are formulated for the special case of spherically symmetrical GRIN. A computer code for designing a GRIN lens and for determining aberrations has been developed. A different program (LENS) calculates lens design and lens performance for the case of homogeneous refractive index. Results of this program provide a check on the more complex program which includes GRIN. The computed program calculates the spot diagram for both meridianal and skew rays. The spot diagram, which is the intersection of rays with the focal plane, is plotted, and the σ_{rms} and centroid location of the spot diagram are calculated. Also a cumulative energy diagram is obtained from the program. The computer code has been organized to calculate the items enumerated above for either a circular cone for the inside or outside surface of the pointed lens. For homogeneous refractive index, both cases are included in the program discussed in this report. However, for the GRIN case, only the complete program for a lens with a conical surface on the outside is reported here. The alternate case is being developed by a thesis student.

Features of the computer program include the following: use of many subroutines for clarity and for easy modification, and use of program structure for easy integration into an optimization code.

Sample lens designs and lens performance are presented. The computer code provides the tools for lens design. Considerable additional work is needed for selecting the best lens design.

ACKNOWLEDGMENT

The author wishes to acknowledge the valuable help and cooperation that Professor Allen E. Fuhs has given him throughout this work. Also, Captain H. Carr during the performance of his thesis work, has been instrumental in stimulating this effort.

LIST OF FIGURES

1. INTRODUCTION

A long-term conflict exists between optics and aerodynamics for missile nose design. Optics requires a blunt shaped nose similar to that used on the Sidewinder missile. Favorable aerodynamics for supersonic missiles requires a sharp nose which permits an attached shock wave. For rocket powered missiles or projectiles, the sensor and associated optics occupies the complete nose area. The penalty of a blunt nose is high drag. For ramjet propelled missiles or projectiles, the penalty of a blunt nose is poor pressure recovery by the inlet; this statement assumes a nose inlet is used.

In times past, the lens designer had available three design parameters; a satisfactory lens in the general shape of a cone has not been designed. A lens can be designed using homogeneous refractive index which focuses rays; however, off-axis rays have very large aberrations. The thesis by Terrell [1] discusses the design of a conical lens.

A fourth design parameter has become available which is spatially variable refractive index. The associated technology is known as GRIN; see references [2-13]. GRIN is short notation for Gradient Refractive Index. The thesis by Frazier [14] briefly introduced the use of GRIN in lens design; likewise the thesis of Terrell [1] has a brief discussion. The thesis of Carr [15] will have more extensive results.

The development of materials which have variable refractive index has been motivated by optical fiber technology. Optical fibers can propagate a single mode with low losses if an ap-

propriate spatial variation of refractive index exists. Based on the information in reference [2] , the maximum variation of GRIN is limited to a few percent. The report contains twelve sections. In section 3 the problem of the homogeneous case is solved (program LENS) while the GRIN lens design is formulated in section 4 (program GRIN). The flow charts to the computer programs are given in section 5 and 6, and a user's guide to each of the programs is illustrated in section 7. The programs are listed in sections 9 and 10.

2. BRIEF OVERVIEW OF PROBLEM FORMULATION

Define the axial distance as x and radial distance as r in a cylindrical coordinate system. The lens is to be axisymmetric so that angle is not a variable.

In general the shape of the front surface, is a function of r

$$x = F_f(r) \tag{2.1}$$

where subscript f denotes front surface. Likewise the rear surface is a function of r

$$x = F_r(r) \tag{2.2}$$

where subscript r indicates the rear surface.

As a simplification, either the front or rear surface is a circular cone. Terrell [1] treated the case of a conical front surface; Carr [15] is investigating the case of a conical rear surface. This report develops a computer code which calculates either case. A single consistent computer program is used for both cases; this fact is important for application

of optimization codes.

In general, the GRIN can be specified as

$$n = F(x,r) \tag{2.3}$$

The function F involves both spatial variables. However, a less complex GRIN is used which is spherically symmetrical refractive index. In this case

$$n = n(x_c,r') \tag{2.4}$$

where r' is radial distance from the center of symmetry for the sphere. The location of the center of the spherical GRIN is on the lens axis at axial position x_c.

One very important computational advantage of spherical GRIN is that the rays within the lens are confined to a single plane. In the case of skew rays, the plane of the rays is not a meridianal plane of the lens.

The equation for a ray trajectory in a spherically symmetric GRIN geometry is

$$\theta_e = \theta_0 + E\int \frac{dr'}{r'\sqrt{r'^2n^2(r')-E^2}} \tag{2.5}$$

where E is a constant for a ray. The value of E is obtained from

$$E = \varepsilon n_0(r_0')r_0'\sin\Psi_0 \tag{2.6}$$

Define $\vec{r}'$ as a unit vector in the direction of a line extending from x_c to point P in Figure 1. Define $\vec{R}$ as a unit vector of a ray which has been refracted by the surface at point P. The angle Ψ_0 is obtained from

$$\cos \Psi_0 = \vec{r}_0' \cdot \vec{R} \qquad (2.7)$$

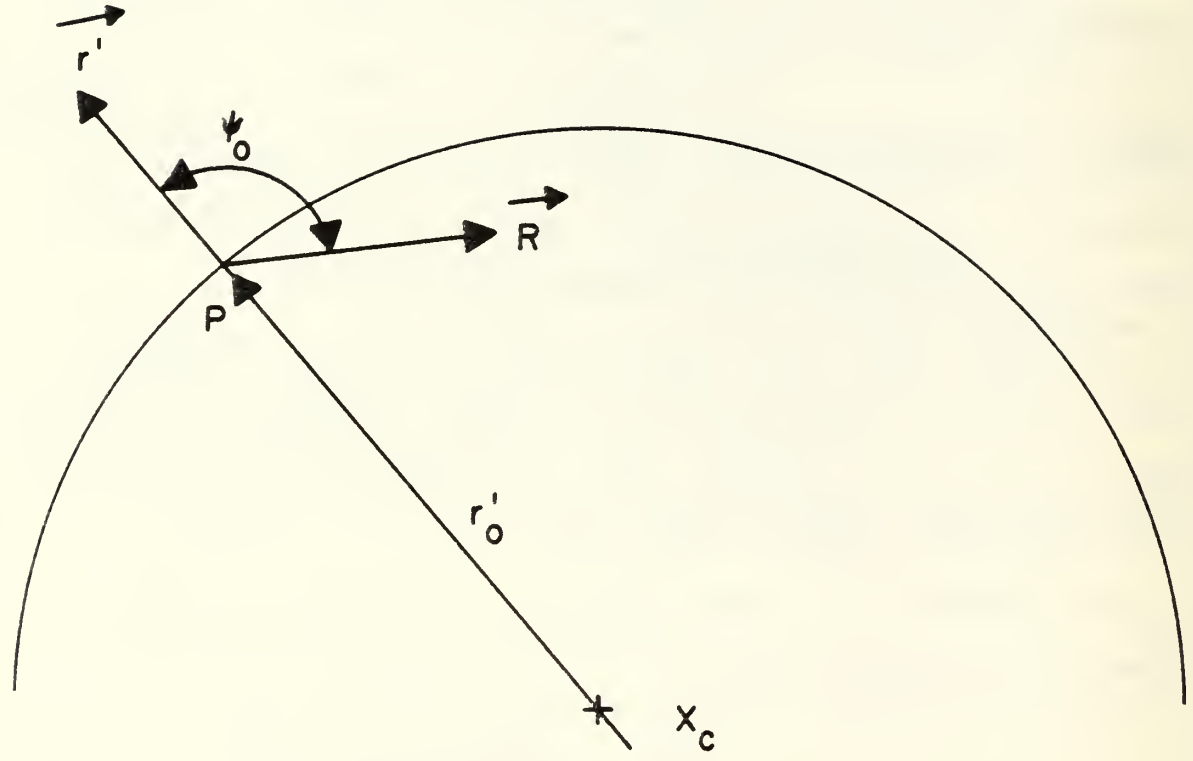

Figure 1. Geometry for Ray Tracing in a Spherically Symmetrical GRIN medium. The ray vector, $\vec{R}$, and the radius vector, $\vec{r}'$, are illustrated.

In equation (2.6), the ε is a sign function having a value of + 1.0 or - 1.0 depending on the value of Ψ within the lens.

$$\varepsilon = \begin{cases} + 1.0 & \Psi \leq \pi/2 \\ - 1.0 & \Psi > \pi/2 \end{cases} \tag{2.8}$$

Equation (2.5) can be integrated for certain functions n(r'). One function is

$$n(r') = \left[A + B(r'/r_0)^2 \right]^{\frac{1}{2}} \tag{2.9}$$

where A and B are constants. r_0 is a value associated with a specific lens design; a convenient value for r_0 is that value for the ray defining the lens aperture.

Combining equations (2.5) and (2.9) and completing the integration yields

$$\theta_e(r') = -\tfrac{1}{2} \left[\sin^{-1} \left\{ \frac{2E^2/r_r'^2 - A}{(A^2+4BE^2/r_0^2)^{\frac{1}{2}}} \right\} - \sin^{-1} \left\{ \frac{2E^2/r_f'^2 - A}{(A^2+4BE^2/r_0^2)^{\frac{1}{2}}} \right\} \right] \tag{2.10}$$

Equation (2.10) is an explicit relation for θ_e as a function of r'. r_r, r_f are the radii to the rear surface and to the front surface respectively. An explicit relation for r' as a function of θ_e can be derived; the result is

$$r'_{(r,f)}(\theta_e) = \frac{\sqrt{2}\,|E|}{\left(A + \sqrt{A^2+4BE^2/r_0^2} \cdot \sin \left\{ \mp 2\theta_e + \sin^{-1} \left[\frac{2E^2/r_{(r,f)} - A}{\sqrt{A^2+4BE^2/r_0^2}} \right] \right\} \right)^{\frac{1}{2}}} \tag{2.11}$$

For details look at section 4.1. For certain phases of the calculation equation (2.11) is needed.

Thinking ahead to numerical optimization, the function of equation (2.9) was chosen to avoid numerical integration of equation (2.5). Equation (2.5) must be evaluated several times for each ray. A lens design may involve 100 to 1000 rays. Numerical optimization of the lens requires calculation of many different lens shapes. Hence, evaluation of equation (2.5) may occur several thousand times in the process of lens optimization. The GRIN-related parameters to be determined in optimization are A, B and x_c.

3. EQUATIONS FOR THE HOMOGENEOUS CASE

3.1 Meridian Plane

The homogeneous case is included here for several reasons. First, the homogeneous case is a simple example in which the intricacies of lens design are apparent in considerable clarity. Iteration is not required for design of a lens with a homogeneous refractive index, whereas for GRIN, iteration is necessary. Second, the homogeneous case provides a meaningful check of the GRIN program. To conduct the check, the value of B is zero in equation (2.9). Obviously the answers from GRIN program with B equal to zero must agree with answers from the homogeneous case.

The book by Kingslake [16] has been helpful in the program development.

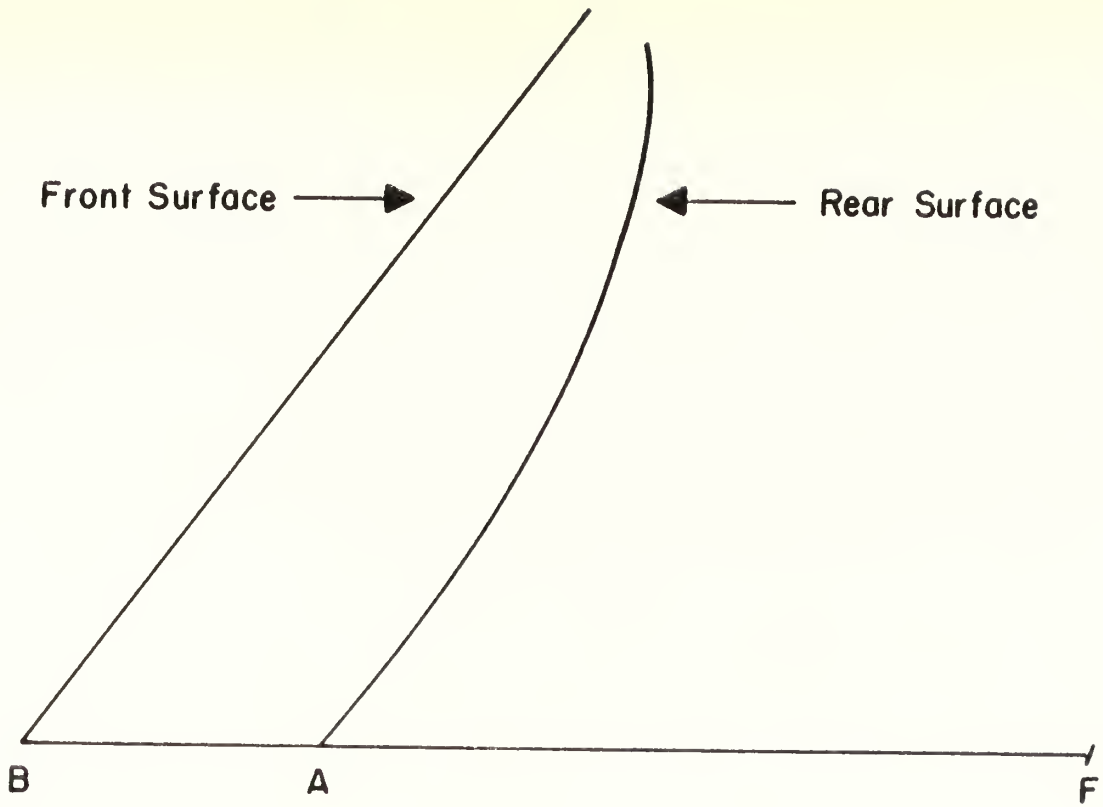

Figure 2. Diagram illustrating the shape of the front and rear surfaces of a GRIN lens. BAF is axis of symmetry. F is the focal point.

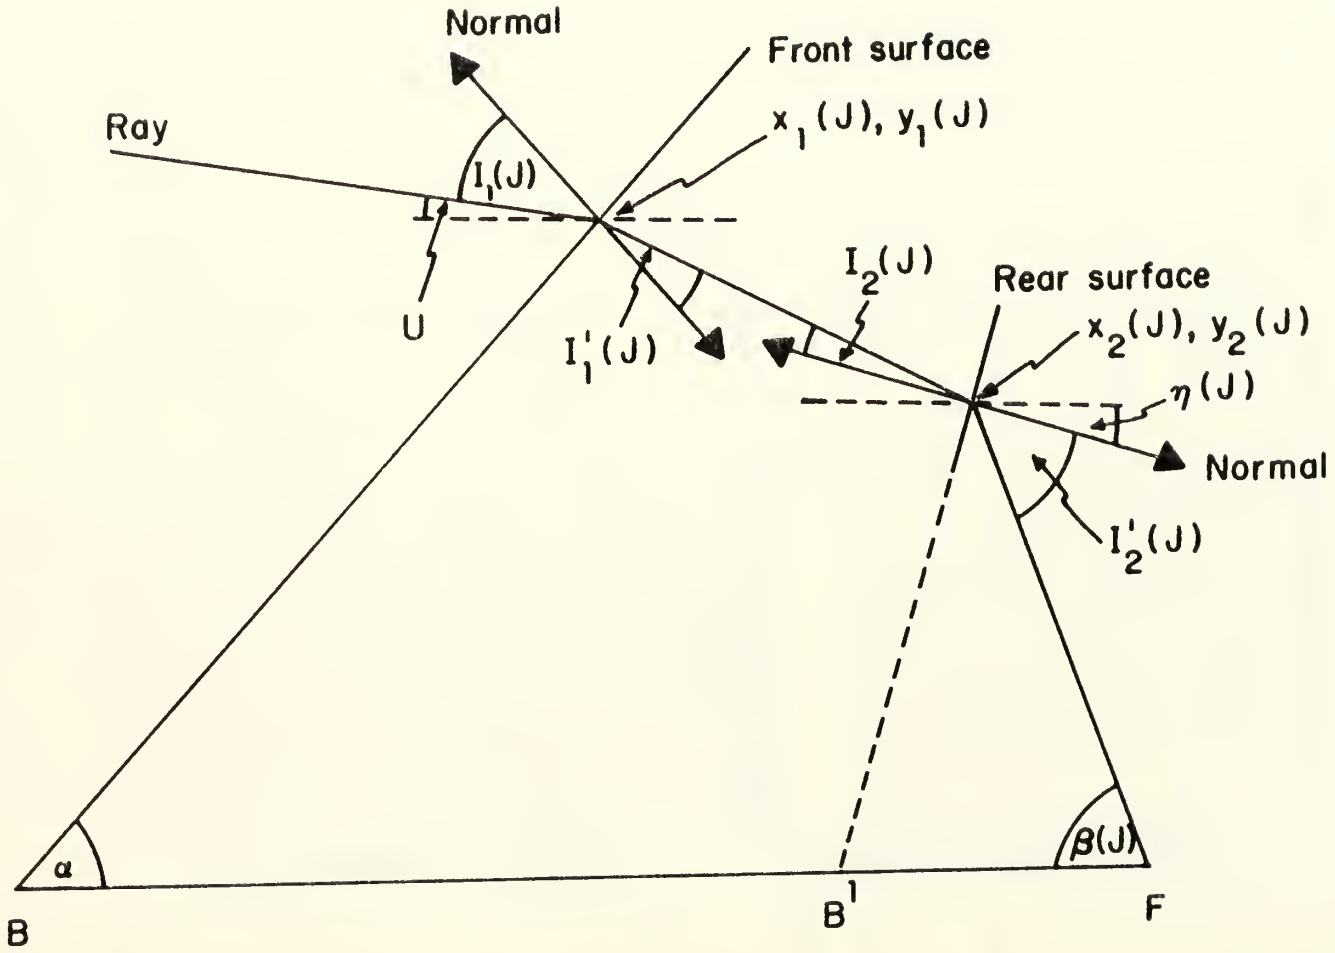

Figure 3. Geometry and angle definitions for the homogeneous refractive index case.

3.1.1 The Equations

Refer to Figure 3 for definition of the symbols.

$$\eta(J) + I_2'(J) = \beta(I) \tag{3.1}$$

$$\sin(I_2[J]) = n_{32} \cdot \sin(I_2'[J]) \tag{3.2}$$

The notation n_{32} is used for the ratio n_3/n_2.

$$I_1'(J) = (\pi/2-\alpha) - (\eta(J) + I_1(J)) \tag{3.3}$$

$$\sin(I_1[J]) = n_{21} \cdot \sin(I_1'[J]) \tag{3.4}$$

$$\alpha + I_1(J) + U = \pi/2 \tag{3.5}$$

3.1.2 Solution

The angles α, $\beta(J)$ are inputs and are known.

From eq. (3.5):

$$I_1(J) = \pi/2 - \alpha - U \tag{3.5.1}$$

From eq. (3.4):

$$I_1'(J) = \sin^{-1}[n_{12} \cdot \sin(I_1[J])] \tag{3.4.1}$$

Substitute eq. (3.5) to eq. (3.3):

$$\eta(J) + I_2(J) = I_1(J) - I_1'(J) + U \tag{3.3.1}$$

But from eq. (3.2):

$$I_2'(J) = \sin^{-1}[n_{32} \cdot \sin(I_2[J])] \tag{3.2.1}$$

From eq. (3.3.1):

$$I_2(J) = [I_1(J) - I_1'(J)] - \eta(J) - U \tag{3.3.2}$$

Substitute eq. (3.3.2) into eq. (3.2.1):

$$I_2'(J) = \sin^{-1}[n_{23} \cdot \sin\{I_1(J) - I_1'(J) - \eta(J) + U\}] \tag{3.2.2}$$

Substitute eq. (3.2.2) into eq. (3.1):

$$\eta(J) + \sin^{-1}[n_{23} \cdot \sin\{I_1(J) - I_1'(J) - \eta(J) + U\}] = \beta(J) \tag{3.1.1}$$

Equation (3.1.1) is solved for $\eta(J)$:

$$n_{23} \cdot \sin(I_1(J) - I_1'(J) - \eta(J) + U) = \sin[\beta(J) - \eta(J)] \tag{3.1.2}$$

Use the formula:

$$\sin(A \pm B) = \sin A \cos B \pm \cos A \sin B$$

And substitute:

$$x = \sin(\eta(J)) \; ; \; \sqrt{1 - x^2} = \cos(\eta(J))$$

Equation (3.1.2) will turn into the form:

$$x = \sqrt{\frac{1}{1 + A^2}} \tag{3.1.3}$$

Where:

$$A = \frac{n_{23} \cdot \cos[I_1(J) - I_1'(J) + U] - \cos[\beta(J)]}{n_{23} \cdot \sin[I_1(J) - I_1'(J) + U] - \sin[\beta(J)]} \tag{3.1.4}$$

Therefore:

$$\eta(J) = \sin^{-1}[x] \tag{3.1.5}$$

Knowing $\eta(J)$, $I_2'(J)$ can be solved from equation (3.1), and then, $I_2(J)$ can be solved from equation (3.2).

3.1.3 Coordinates of the Front and of the Rear Surfaces

3.1.3.1 The First Ray

All the magnitudes will be normalized with respect to the radius R. R is the aperture for the lens. Therefore:

$$R = 1.0 \begin{cases} y_1(1) = R \\ x_1(1) = \dfrac{R}{\tan(\alpha)} \end{cases} \tag{3.6}$$

The thickness of the lens is defined:

$$T(1) = \sqrt{[x_2(1) - x_1(1)]^2 + [y_1(1) - y_2(1)]^2} \qquad (3.7)$$

Therefore, the appropriate coordinates of the rear surface are:

$$\begin{cases} x_2(1) = x_1(1) + T(1) \cdot \cos[\pi/2 - \alpha - I_1'(1)] \\ y_2(1) = y_1(1) - T(1) \cdot \sin[\pi/2 - \alpha - I_1'(1)] \end{cases} \qquad (3.8)$$

3.1.3.2 The Other Rays: Coordinates of the Rear Surface

The new point of the rear surface $x_2(J), y_2(J)$ will be the intersection between the surface and the ray.

(a) The equation of the surface:

$$y_2(J) = m[x_2(J) - BB'] \qquad (3.9)$$

$$m = \tan[\pi/2 - \eta(J - 1)] = \cot[\eta(J - 1)] \qquad (3.9.1)$$

$$BB' = BF - B'F$$

$$B'F = y_2(J - 1) \cdot [\cot[\pi/2 - \eta(J - 1)] + \cot[\beta(J - 1)]]$$

$$\therefore B'F = y_2(J - 1) \cdot \{\tan[\eta(J - 1)] + \cot[\beta(J - 1)]\} \qquad (3.9.2)$$

$$\therefore y_2(J) = \cot[\eta(J - 1)]\{x_2(J) - [BF - B'F]\} \qquad (3.9.3)$$

(b) The equation of the ray:

$$y_2(J) = -\tan[\beta(J)]x_2(J) + BF \cdot \tan[\beta(J)] \qquad (3.10)$$

$$\therefore y_2(J) = \tan[\beta(J)] \cdot \{-x_2(J) + BF\} \qquad (3.10.1)$$

From equations (3.9.3) and (3.10.1), the coordinates of the next point at the rear surface are found; those are:

$$\begin{cases} x_2(J) = \dfrac{BF\{\tan[\beta(J)] + \cot[\eta(J - 1)]\} - \cot[\eta(J-1)] \cdot B'F}{\cot[\eta(j - 1)] + \tan[\beta(J)]} \\ y_2(J) = \tan[\beta(J)]\{-x_2(J) + BF\} \end{cases} \qquad (3.11)$$

3.1.3.3 Coordinates of the Front Surface

(a) Equation of the rear surface:

$$y_1(J) = (\tan\alpha) \cdot x_1(J) \tag{3.12}$$

(b) Equation of the ray:

$$y_1(J) = m[x_1(J) - x_2(J)] + y_2(J) \tag{3.13}$$

where:
$$m = -\tan[\pi/2 - \alpha - I_1'(J)] \tag{3.13.1}$$

or:
$$m = -\cot[\alpha + I_1'(J)] \tag{3.13.2}$$

From equations (3.12) and (3.13) the intercept point is calculated:

$$x_1(J) = \frac{y_2(J) + x_2(J) \cdot \cot[\alpha + I_1'(J)]}{\tan\alpha + \cot[\alpha + I_1'(J)]}$$

$$y_1(J) = (\tan\alpha) \cdot x_1(J) \tag{3.14}$$

3.1.3.4 The Thickness at the New Point

$$T(J) = \sqrt{[x_2(J) - x_1(J)]^2 + [y_1(J) - y_2(J)]^2} \tag{3.15}$$

3.2 Skew Rays in the Homogeneous Case

3.2.1 Coordinate Transformation

The x,y coordinates will be shifted by the angle α_p.

$$x' = x \cdot \cos(\alpha_p) - y \cdot \sin(\alpha_p) \tag{3.16.1}$$

$$y' = x \cdot \sin(\alpha_p) + y \cdot \cos(\alpha_p) \tag{3.16.2}$$

$$z' = z \tag{3.16.3}$$

3.2.2 Calculate the Intercept Point of the Front Surface

Assuming that the (0,0) point is at point A

(Refer to figure 2.), the following equations can be derived:

(a) Ray: $R_{ray}^2 = y^2 + z^2$ (3.17.1)

$$\therefore R_{ray} = \left[\frac{y_0'}{\cos(\alpha_p)} - (x + AB) \cdot \tan(\alpha_p)\right]^2 + z_0'^2 \quad (3.17.2)$$

Where R_{ray} is the radius of the ray and the values for y_0', z_0' are known.

(b) Cone: $R_{cone} = \tan(\alpha) \cdot [x + AB]$ (3.18)

Solving equations (3.17.2), (3.18) for x results:

$$XO = -\frac{CDS}{A_2D_2} + \frac{\sqrt{CDS^2 + A_2D_2 \cdot CZD}}{A_2D_2} \quad (3.19.1)$$

$$YO = \frac{y_0'}{\cos(\alpha_p)} - XO \cdot \tan(\alpha_p) \quad (3.19.2)$$

$$ZO = z_0' \quad (3.19.3)$$

Where:

$$A_2D_2 = (\tan\alpha)^2 - (\tan\alpha_p)^2 \quad (3.20.1)$$

$$CDS = \frac{y_0'}{\cos\alpha_p} \tan\alpha_p + (AB)[A_2D_2] \quad (3.20.2)$$

$$CZD = \left(\frac{y_0'}{\cos\alpha_p}\right)^2 + z_0'^2 - (AB)^2[A_2D_2]^2 - 2(AB)\frac{y_0'}{\cos\alpha_p}\tan\alpha_p \quad (3.20.3)$$

3.2.3 Direction Cosines of the Normal

$$f = y^2 + z^2 - (\tan\alpha)^2(x + AB)^2 = 0 \quad (3.21)$$

$$\frac{\delta f}{\delta x} = -2(\tan\alpha)^2(x + AB) \quad (3.21.1)$$

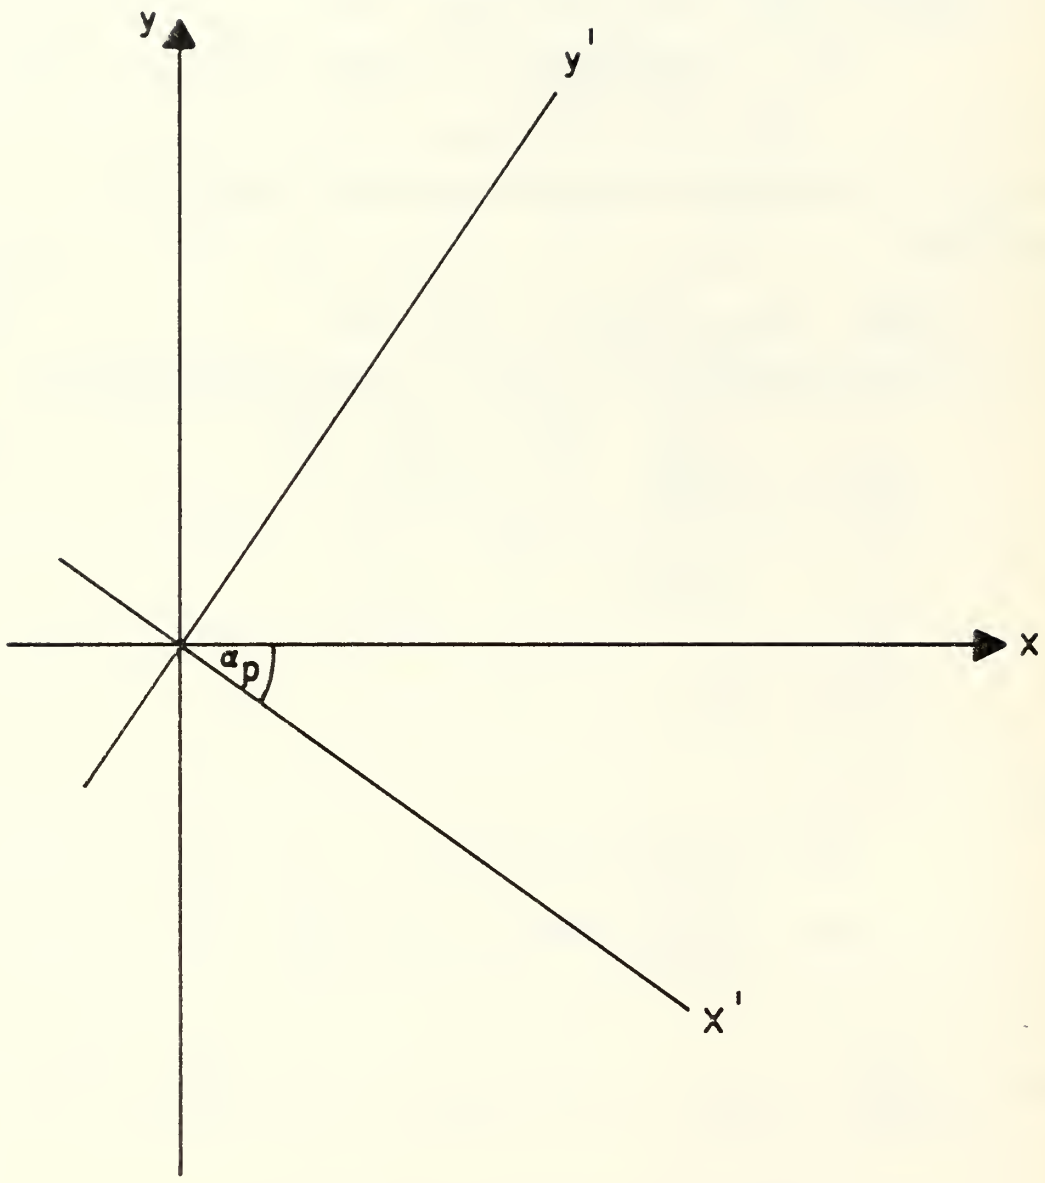

Figure 4. Diagram showing coordinate transformation for off-axis rays.

$$\frac{\delta f}{\delta y} = 2y \; ; \; \frac{\delta f}{\delta z} = 2z \tag{3.21.2}$$

$$|\overrightarrow{\Delta f}| = 2[(\tan\alpha)^4 (x + AB)^2 + y^2 + z^2]^{\frac{1}{2}} \tag{3.21.4}$$

Substituting equation (3.21) can turn equation (3.21.4) into the form:

$$|\overrightarrow{\Delta f}| = \frac{2\tan\alpha}{\cos\alpha} (x + AB) \tag{3.21.5}$$

The direction cosines of the normal are therefore:

$$n_X = \frac{(\delta f/\delta x)}{|\overrightarrow{\Delta f}|} = -\sin\alpha \tag{3.22}$$

$$n_Y = \frac{(\delta f/\delta y)}{|\overrightarrow{\Delta f}|} = \frac{2y}{2\tan\alpha/\cos\alpha\,(x + AB)} \tag{3.23}$$

Define: $\sigma = \tan^{-1}(z/y)$ (3.23.1)

$$y^2 + z^2 = (\tan\alpha)^2 (x + AB)^2$$

$$y^2 (1 + \tan^2\sigma) = \tan^2\alpha (x + AB)^2$$

$$y = (\cos\sigma)(\tan\alpha)(x + AB) \tag{3.23.2}$$

Therefore:

$$n_Y = (\cos\sigma)(\cos\alpha) \tag{3.23.3}$$

Similiarly:

$$n_Z = \frac{(\delta f/\delta z)}{|\overrightarrow{\Delta f}|} = (\sin\sigma)(\cos\alpha) \tag{3.24}$$

3.2.4 Refraction at the Front Surface

The skew ray $\vec{R}$ will be defined:

$$\vec{R} = R_X \cdot (\hat{e}_X) + R_Y \cdot (\hat{e}_Y) + R_Z \cdot (\hat{e}_Z) \tag{3.25}$$

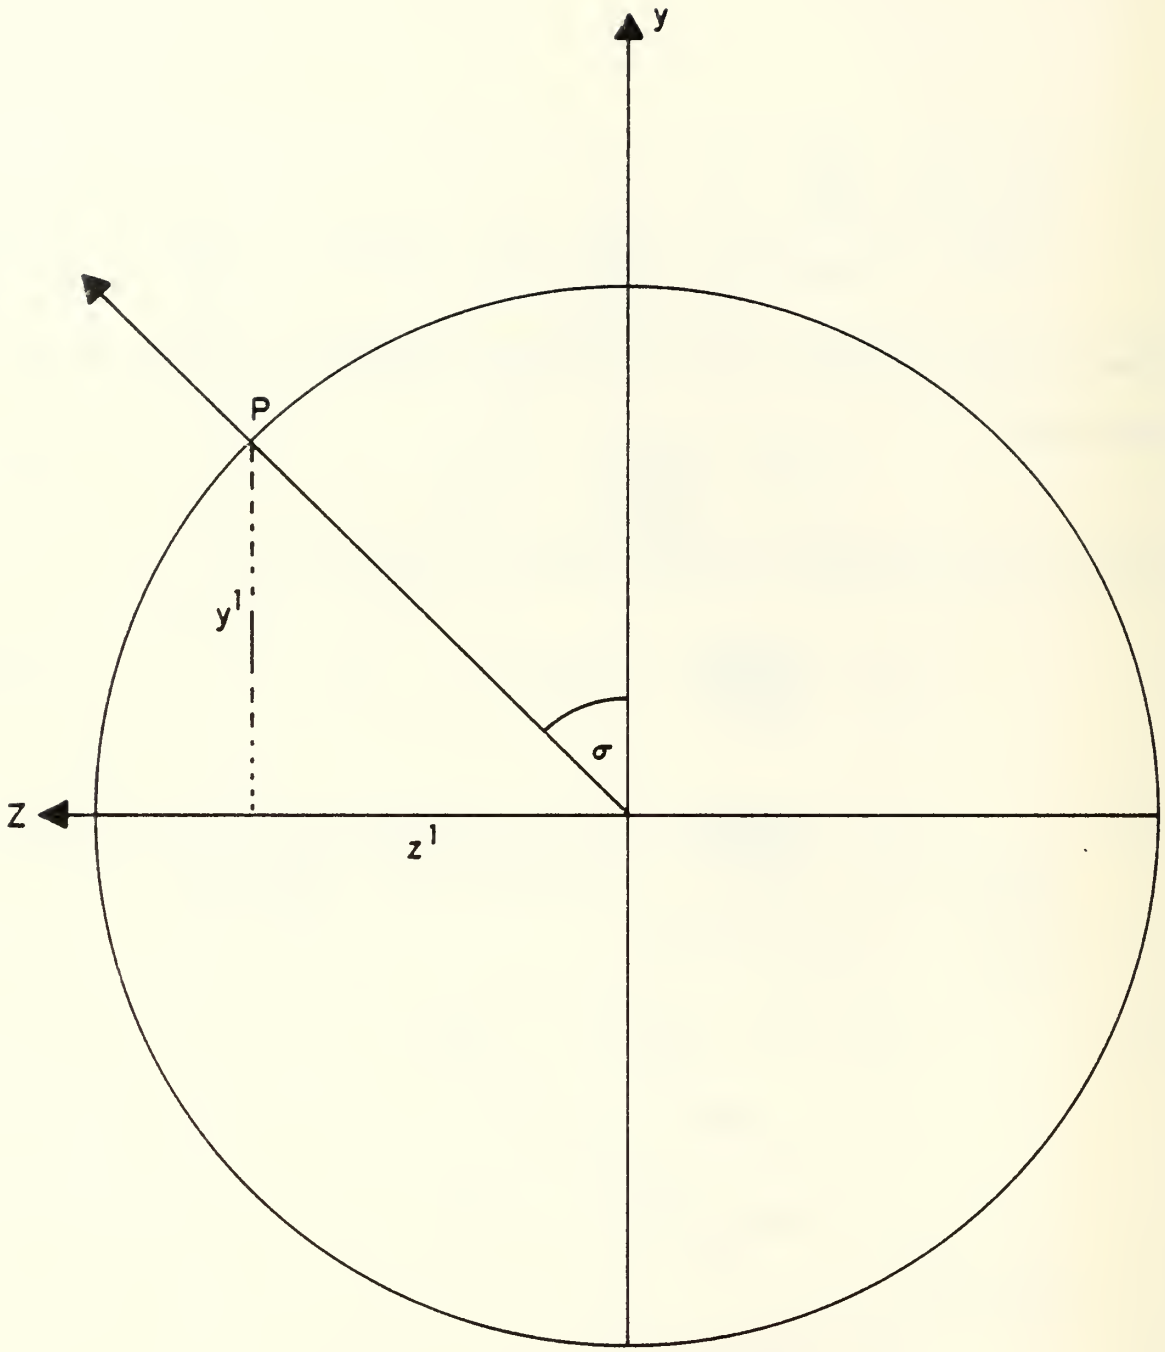

Figure 5. Cross section of lens in a plane normal to the lens axis. Point P is the point where an off-axis ray intersects the front surface of the lens.

Where R_X, R_Y, R_Z are the direction cosines of the ray, and they have the value:

$$R_X = \cos\alpha_p \quad ; \quad R_Y = -\sin\alpha_p \quad ; \quad R_Z = 0 \tag{3.26}$$

The surface normal is defined by the following expression:

$$\vec{N} = n_X \cdot (\hat{e}_X) + n_Y \cdot (\hat{e}_Y) + n_Z(\hat{e}_Z) \tag{3.27}$$

Where the direction cosines of the normal surface were defined previously (equations 3.22, 3.23.3, 3.24).

The refracted angle at the front surface is defined:

$$\theta = \cos^{-1}\left\{\frac{\vec{R} \cdot \vec{N}}{|\vec{R}| \cdot |\vec{N}|}\right\} \tag{3.28}$$

Where:

$$\left.\begin{aligned} |\vec{R}| &= \sqrt{R_X^2 + R_Y^2 + R_Z^2} = 1 \\ |\vec{N}| &= \sqrt{n_X^2 + n_Y^2 + n_Z^2} = 1 \end{aligned}\right\} \tag{3.29}$$

Therefore:

$$\theta = \cos^{-1}\{R_X \cdot n_X + R_Y \cdot n_Y + R_Z \cdot n_Z\} \tag{3.30}$$

$$\left.\begin{aligned} \phi &= \pi - \theta \\ \phi' &= \sin^{-1}[n_{12} \cdot \sin\phi] \end{aligned}\right\} \tag{3.31}$$

3.2.5 Refraction Equations

Referring to figure 6 the refraction at the rear surface with regard to the front surface will be as follows [16, p. 147]:

$$n_2\vec{R}' = n_1\vec{R} + [n_2\cos(\phi') - n_1\cos(\phi)]\vec{N}$$

The direction cosines of the normal surface were defined in

equations (3.22), (3.23.3), (3.24) and the direction cosines of the ray at the front surface were defined in equation (3.26). The direction cosines of the skew ray at the rear surface, will therefore be:

$$\left.\begin{aligned} K' &= n_{12}\, R_Z + [\cos(\phi') - n_{12}\cos(\phi)] \cdot n_X \\ L' &= n_{12}\, R_Y + [\cos(\phi') - n_{12}\cos(\phi)] \cdot n_Y \\ M' &= n_{12}\, R_Z + [\cos(\phi') - n_{12}\cos(\phi)] \cdot n_Z \end{aligned}\right\} \qquad (3.32)$$

3.2.6 Intercept at the Rear Surface

The equation of the cone of the rear surface is:

$$y^2 + z^2 = [ax - b]^2 \qquad (3.33)$$

where a is the slope and is defined from figure 7.

$$a = \tan(\xi_J) = \frac{R_J}{X_J - X_v} = \frac{R_{J+1} - R_J}{X_{J+1} - X_J} \qquad (3.33.1)$$

b is the intercept at the X - axis and is calculated from equation (3.33.1):

$$b = X_v = \frac{R_{J+1} \cdot X_J - R_J \cdot X_{J+1}}{R_{J+1} - R_J} \qquad (3.33.2)$$

(XI, YI, ZI) is the point of intercept at the rear surface. The equation of the rear surface is therefore:

$$YI^2 + ZI^2 - (aXI - b) = 0 \qquad (3.33.3)$$

where a,b were defined in equations (3.33.1), (3.33.2).

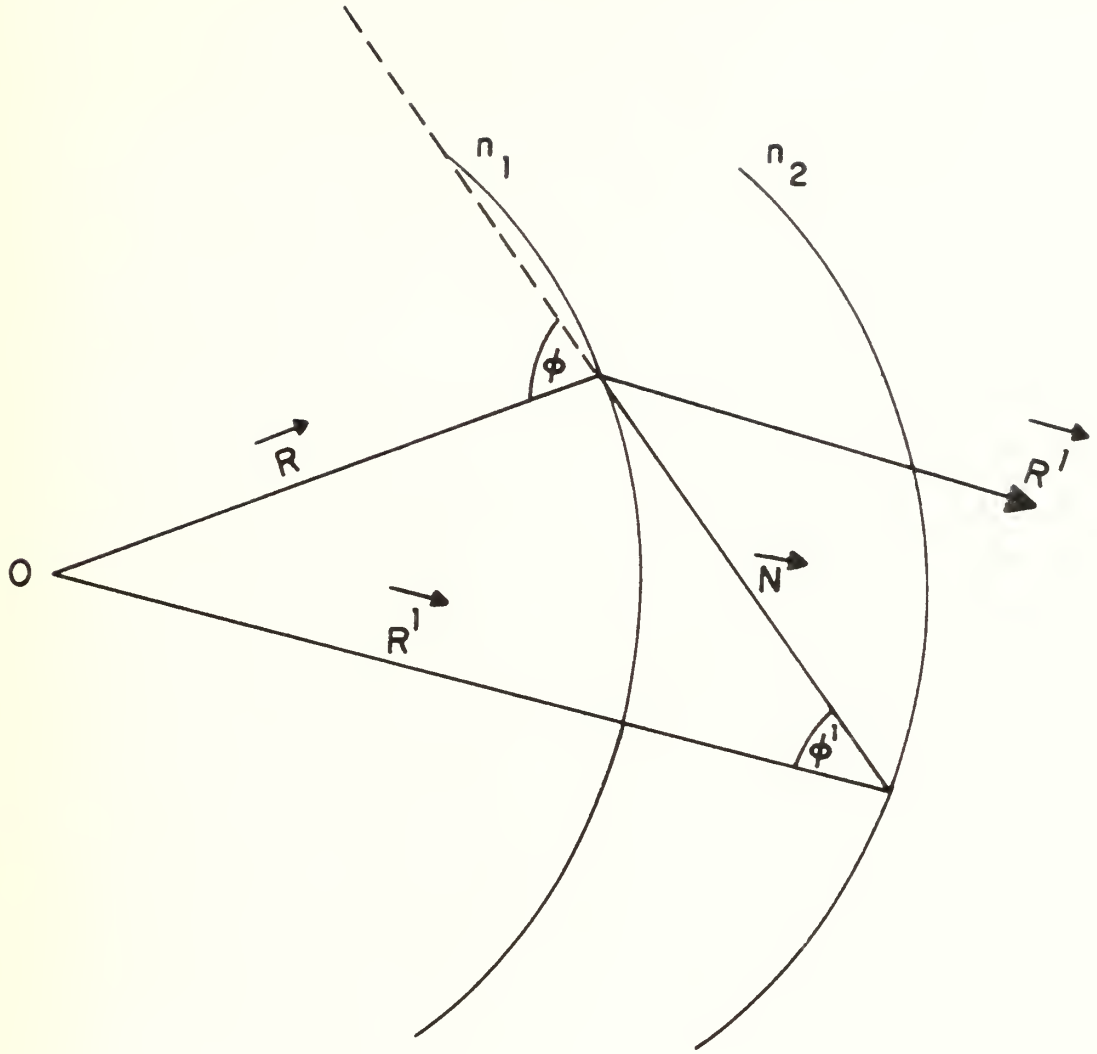

Figure 6. Diagram used to calculate the direction cosines of skew rays at the rear surface. This diagram is based on Kingslake [16].

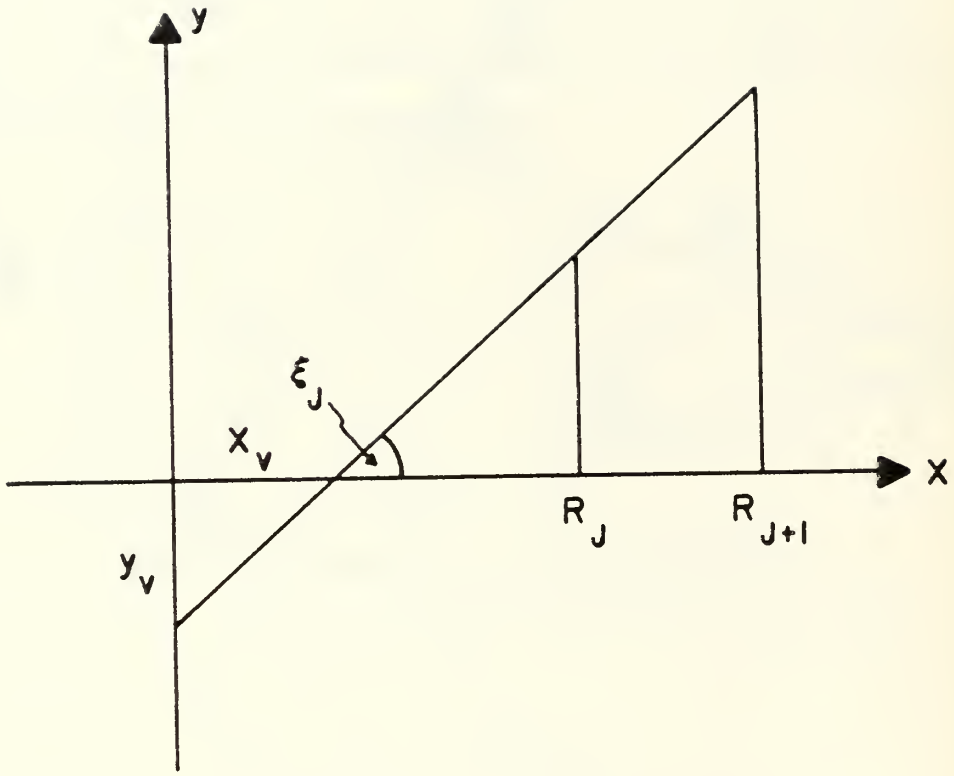

Figure 7. Geometry of a truncated cone which represents a small portion of the rear surface of the lens. The cone angle is ξ_J.

The direction cosines of the ray at the rear surface were defined previously (3.32). They are:

$$K' = \frac{XI - XO}{D} \quad ; \quad L' = \frac{YI - YO}{D} \quad ; \quad M' = \frac{ZI - ZO}{D} \qquad (3.34)$$

(XO, YO, ZO) is the point of intercept at the front surface (3.19.1, 3.19.2, 3.19.3).

$$D = \sqrt{(XI - XO)^2 + (YI - YO)^2 + (ZI - ZO)^2} \qquad (3.35)$$

Solving for D from equations (3.33.3) and (3.34) one gets:

$$D = -\frac{b'}{a'} + \frac{\sqrt{b'^2 - a'c'}}{a'} \qquad (3.36)$$

Where:

$$a' = (L')^2 + (M')^2 - a^2(K')^2 \qquad (3.36.1)$$

$$b' = (L')YO + (M')ZO - (K')a^2(XO - b/a) \qquad (3.36.2)$$

$$c' = YO^2 + ZO^2 - a^2XO(XO - 2b/a) - b^2 \qquad (3.36.3)$$

Knowing D, the intercept point at the rear surface can be verified using equation (3.34):

$$\begin{cases} XI = K'D + XO & (3.37.1) \\ YI = L'D + YO & (3.37.2) \\ ZI = M'D + ZO & (3.37.3) \end{cases}$$

3.2.7 Equation of the Normal to the Rear Surface

The equation of the cone of the rear surface was defined previously (eq. 3.33):

$$f(x,Y,z,) = -(ax - b)^2 + y^2 + z^2 = 0 \qquad (3.33)$$

a,b are defined in equations (3.33.1), (3.33.2).

$$\vec{\nabla} f = \hat{e}_X \frac{\delta f}{\delta X} + \hat{e}_Y \frac{\delta f}{\delta Y} + \hat{e}_Z \frac{\delta f}{\delta Z} \tag{3.38.1}$$

Similar to what was done at the front surface:

$$\frac{\delta f}{\delta X} = -2a(ax - b) \tag{3.38.2}$$

$$\frac{\delta f}{\delta Y} = 2y \quad ; \quad \frac{\delta f}{\delta Z} = 2z \tag{3.38.3}$$

$$\begin{aligned} \left|\vec{\nabla} f\right| &= [(\frac{\delta f}{\delta X})^2 + (\frac{\delta f}{\delta Y})^2 + (\frac{\delta f}{\delta Z})^2]^{\frac{1}{2}} \\ &= 2[a^2(ax - b)^2 + y^2 + z^2]^{\frac{1}{2}} \\ &= 2(ax - b)[(1 + a^2)^{\frac{1}{2}}] \end{aligned} \tag{3.38.4}$$

The direction cosines of the normal to the surface are as follows:

$$n_X = \frac{(\delta f/\delta X)}{\left|\vec{\nabla} f\right|} = \frac{-a}{(1 + a^2)^{\frac{1}{2}}} \tag{3.39.1}$$

$$n_Y = \frac{y}{(y^2 + z^2)^{\frac{1}{2}}(1 + a^2)^{\frac{1}{2}}} \tag{3.39.2}$$

$$n_Z = \frac{z}{(y^2 + z^2)^{\frac{1}{2}}(1 + a^2)^{\frac{1}{2}}} \tag{3.39.3}$$

3.2.8 Refraction at the Rear Surface

Similar to what was done at the front surface:

$$\vec{R}' = K'(\hat{e}_X) + L'(\hat{e}_Y) + M'(\hat{e}_Z) \tag{3.40.1}$$

$$\vec{N} = n_X(\hat{e}_X) + n_Y(\hat{e}_Y) + n_Z(\hat{e}_Z) \tag{3.40.2}$$

Where the direction cosines of the refracted ray ($\vec{R}'$) and the normal ($\vec{N}'$) were defined previously (equations 3.32, 3.39).

The refracted angle at the rear surface:

$$\phi_I = \cos^{-1} \frac{\vec{R}' \cdot \vec{N}'}{|\vec{R}'| \cdot |\vec{N}'|} \tag{3.41}$$

Both the ray and the normal are normalized; therefore:

$$\phi_I = K'n_X + L'n_Y + M'n_Z \tag{3.41.1}$$

$$\phi_I' = \sin^{-1}[n_{23} \cdot \sin\phi_I] \tag{3.41.2}$$

3.2.9 Direction Cosines of Rear External Refracted Ray

As done previously (equation 3.32):

$$\left.\begin{aligned} K'' &= n_{23}K' - [\cos(\phi_I') - n_{23}\cos(\phi_I)] \cdot n_X \\ L'' &= n_{23}L' - [\cos(\phi_I') - n_{23}\cos(\phi_I)] \cdot n_Y \\ Z'' &= n_{23}Z' - [\cos(\phi_I') - n_{23}\cos(\phi_I)] \cdot n_Z \end{aligned}\right\} \tag{3.42}$$

3.2.10 Intersection with the Image Plane

$$\left.\begin{aligned} X_{Im} &= BF = D_3K'' + XI \\ Y_{Im} &= D_3L'' + YI \\ Z_{Im} &= D_3M'' + ZI \end{aligned}\right\} \tag{3.43}$$

Solving equation (3.43), the intercept with the image plane can be calculated:

$$\left.\begin{aligned} D_3 &= (BF - XI)/K'' \\ Y_{Im} &= \left(\frac{BF - XI}{K''}\right) L'' + YI \\ Z_{Im} &= \left(\frac{BF - XI}{K''}\right) M'' + ZI \end{aligned}\right\} \tag{3.43.1}$$

4. FORMULATION OF EQUATIONS FOR GRIN LENS DESIGN

4.1 Solving the Integral for θ_e

As mentioned in section 2:

$$\theta_e = \theta_0 + E\int_{r_f}^{r_r} \frac{d_r}{r\{r^2 n(r)^2 - E^2\}^{\frac{1}{2}}} \tag{4.1}$$

r_f, r_r are the radii to the front surface and to the rear surface, respectively.

$$E = \varepsilon \cdot n_2(r_f) \cdot r_f \cdot \sin\psi_f \tag{4.2}$$

$$n = \sqrt{A + B\left(\frac{r}{r_0}\right)^2} \tag{4.3}$$

Substituting:

$$V = \left(\frac{r_0}{r}\right)^2 \quad ; \quad \frac{dV}{dr} = -2r_0{}^2 r^{-3} \tag{4.1.1}$$

Equation (4.1) turns into the form:

$$\theta_e = \theta_0 - \frac{E}{2r_0}\int_{V_f}^{V_r} \frac{dV}{\left\{AV + b - V^2\frac{E^2}{r_0{}^2}\right\}^{\frac{1}{2}}} \tag{4.1.2}$$

Therefore:

$$\theta_e = -\tfrac{1}{2}\left[\sin^{-1}\left\{\frac{2(E/r_0)^2 V - A}{(A^2 + 4BE^2/r_0{}^2)^{\frac{1}{2}}}\right\}\right]_{(r_0/r_f)^2}^{(r_0/r_r)^2}$$

or:

$$\theta_e = -\tfrac{1}{2}\left[\sin^{-1}\left\{\frac{2E^2/r_r{}^2 - A}{(A^2 + 4BE^2/r_0{}^2)^{\frac{1}{2}}}\right\} - \sin^{-1}\left\{\frac{2E^2/r_f{}^2 - A}{(A^2 + 4BE^2/r_0{}^2)^{\frac{1}{2}}}\right\}\right] \tag{4.1.3}$$

The appropriate expression for the radius will therefore be:

$$r_{(r,f)} = \frac{\sqrt{2}|E|}{\sqrt{A + \sqrt{A^2 + 4BE^2/r_0^2}} \cdot \sin\left\{\mp 2\theta_e + \sin^{-1} \frac{2E^2/r_{(f,r)} - A}{\sqrt{A^2 + 4BE^2/r_0^2}}\right\}} \tag{4.4}$$

If the radius to the rear surface (r_r) is calculated from a known radius to the front surface (r_f) the minus sign is used in front of the angle θ_e. This situation occurs with skew ray calculation. The plus sign is used when r_f is calculated from a known r_r. This situation occurs for lens design.

4.2 Meridian Plane

4.2.1 Solution for the First Ray

(a) Define Point $X_1(1), Y_1(1)$

As in the homogeneous case:

$$\left.\begin{aligned} R &= 1.0 \\ Y_1(1) &= R \\ X_1(1) &= \frac{R}{\tan\alpha} \end{aligned}\right\} \tag{4.5}$$

(b) Define Angle to the Front Radius

$$\tan(\theta_0 + \theta_e) = \frac{R}{X_1(1) - X_C} \tag{4.6}$$

$$r_f(1) = r_0 = \frac{R}{\sin(\theta_0(1) + \theta_e(1))} \tag{4.7}$$

Refering to figure 8, θ_0 is the angle to the rear radius, θ_e

is the angle between the rear and the front radii, and X_C is the location of the center of symmetry.

(c) Choose θ_e from Initial Thickness

$$\left.\begin{aligned} \theta_e(1) &= T(1)/r_f(1) \\ \theta_0(1) &= (\theta_0(1) + \theta_e(1)) - \theta_e(1) \end{aligned}\right\} \quad (4.8)$$

(d) Solve for ψ_f

$$\left.\begin{aligned} \alpha + I_1(1) + u &= \pi/2 \\ I_1(1) &= \pi/2 - \alpha - u \end{aligned}\right\} \quad (4.9)$$

Knowing $r_f(1)$, the initial index of refraction $(n_2(r_f))$ can be calculated from eq. (4.3). Therefore:

$$\sin(I_1(1)) = n_2(r_f)/n_3 \cdot \sin(I_1'(1))$$
$$I_1'(1) = \sin^{-1}[n_3/n_2(r_f) \cdot \sin[I_1(1)]] \quad (4.10)$$

Refering to figure 8, ψ_f can be calculated.

$$\theta_e(1) + \theta_0(1) = \alpha + \delta$$
$$\therefore \delta = \theta_e(1) + \theta_0(1) - \alpha \quad (4.11)$$
$$\delta + \psi_f(1) - I_1'(1) = \pi/2$$
$$\psi_f(1) = \pi/2 + I_1'(1) - \delta \quad (4.12)$$

(e) Solve for E

$$E = \varepsilon \cdot n_r(r_f) \cdot r_f \cdot \sin\psi_f \quad (4.2)$$

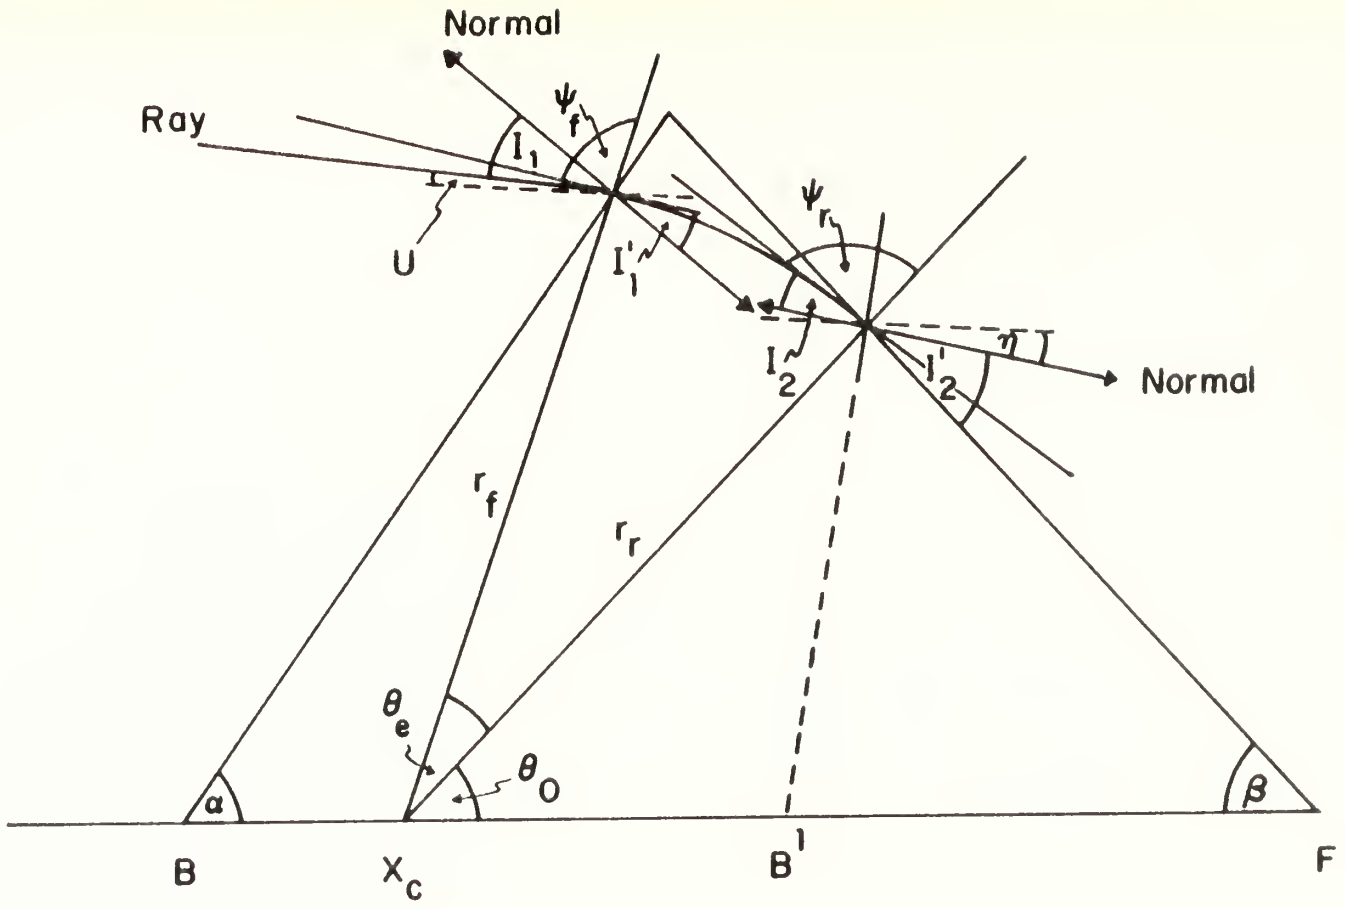

Figure 8. Diagram degining angles and coordinates for a ray transmitted by the GRIN lens. For the case illustrated B is negative.

Where:
$$\varepsilon = \pm 1 \begin{cases} \psi \leq \pi/2 \rightarrow \varepsilon = +1 \\ \psi > \pi/2 \rightarrow \varepsilon = -1 \end{cases} \qquad (4.2.1)$$

(f) Solve for r_f, ψ_r

Knowing the radius to the front surface (r_f) and the angle between the two radii (θ_e), the radius to the rear surface (r_r) can be calculated using equation (4.4). Using equation (4.2), ψ_r can be calculated:

$$\psi_r = \sin^{-1}\left[\frac{E}{\varepsilon \cdot n_2(r_r) \cdot r_r}\right] \qquad (4.2.2)$$

(g) Solve for $\beta(1)$

The focal length, which is an input, is known:

$$BF = F/R$$

The coordinates at the rear surface are:

$$\left.\begin{aligned} Y_2(1) &= r_r \sin(\theta_0(1)) \\ X_2(1) &= X_C + r_r \cos(\theta_0(1)) \end{aligned}\right\} \qquad (4.13)$$

Using equation (4.13), $\beta(1)$ can be calculated:

$$\beta(1) = \tan^{-1}\left[\frac{Y_2(1)}{BF - X_2(1)}\right] \qquad (4.14)$$

(h) Solve for the Refractive Angles at the Front Surface

As in the homogeneous case:

$$\eta(J) + I_2'(J) = \beta(J) \tag{4.15}$$

$$\sin[I_2(J)] = n_3/n_2(r_r) \cdot \sin[I_2'(J)] \tag{4.16}$$

$$\psi_r(J) + I_2(J) + \eta(J) + \theta_0(J) = \pi \tag{4.17}$$

Solve for $\eta(J)$ in a manner similar to the homogeneous case:

$$\eta(J) = \sin^{-1}\left[\sqrt{\frac{1}{1 + A^2}}\right] \tag{4.18}$$

Where:

$$A = \frac{\cos\delta' - n_3/n_2(r_r) \cdot \cos\beta(J)}{\sin\delta' - n_3/n_2(r_r) \cdot \sin\beta(J)} \tag{4.18.1}$$

Where:

$$\delta' = \pi - \theta_0(J) - \psi_0(J) \tag{4.18.2}$$

Knowing $\eta(J)$, $I_2'(J)$ can be solved from eq. (4.15) and then, $I_2(J)$ can be solved from equation (4.16).

4.2.2 Solution for Next Rays

4.2.2.1 Coordinates at the Rear Surface

Solve for the subsequent rays the same way as in the homogeneous case (equations 3.10, 3.10.1).

4.2.2.2 Calculate Radius and Angle to the Rear Surface

$$r_r(J) = \sqrt{(X_2(J) - X_C)^2 + Y_2(J)^2} \tag{4.19}$$

$$\theta_0(J) = \tan^{-1}[Y_2(J)/(X_2(J) - X_C)] \tag{4.20}$$

4.2.2.3 Solve Front Surface Parameters

Refer to Figure 8 for a definition of geometrical variables.

(a) Equations

$$\eta(J) + I_2'(J) = \beta(J) \tag{4.15}$$

$$\sin[I_2(J)] = n_3/n_2(r_r) \cdot \sin[I_2'(J)] \tag{4.16}$$

$$\psi_r(J) + I_2(J) + \eta(J) + \theta_0(J) = \pi \tag{4.17}$$

$$E = \varepsilon \cdot n_2(r_r) \cdot r_r \cdot \sin[\psi_r(J)] \tag{4.2.2}$$

$$E = \varepsilon \cdot n_2(r_f) \cdot r_f \cdot \sin[\psi_f(J)] \tag{4.2}$$

$$\theta_e(J) + \theta_0(J) = \alpha + \delta \tag{4.21}$$

$$\delta + \psi_f(J) - I_1'(J) = \pi/2 \tag{4.22}$$

$$r_f = f(r_r, \theta_e(J)) \tag{4.4}$$

$$\sin[I_1(J)] = n_2(r_f)/n_1 \cdot \sin[I_1'(J)] \tag{4.23}$$

$$\alpha + I_1(J) + u = \pi/2 \tag{4.24}$$

(b) Solution by Iteration

An explicit solution is not possible. An iterative solution is necessary.

(b1) Assume $\theta_e(J)$.

(b2) Solve for coordinates of the front surface:

- Calculate $I_1(J)$ from eq. (4.24)
- Calculate δ from eq. (4.21)
- Calculate front surface coordinates and radius:

$$Y_1(J) = \tan(\theta_0(J) + \theta_e(J)) \cdot (X_1(J) - X_C) \qquad (4.25)$$

$$Y_1(J) = \tan\alpha \cdot X_1(J) \qquad (4.26)$$

The result is:

$$\begin{cases} X_1(J) = \dfrac{X_C \cdot \tan[\theta_0(J) + \theta_e(J)]}{\tan[\theta_0(J) + \theta_e(J)] - \tan\alpha} & (4.27) \\ Y_1(J) = \tan\alpha \cdot X_1(J) & (4.26) \end{cases}$$

$$r_f = Y_1(J)/\sin[\theta_0(J) + \theta_e(J)] \qquad (4.28)$$

$$= \frac{X_C \cdot \tan\alpha}{\sin[\theta_0(J) + \theta_e(J)] - \tan\alpha \cdot \cos[\theta_0(J) + \theta_e(J)]} \qquad (4.28.1)$$

(b3) Knowing r_f, $I_1'(J)$ can be solved using equation (4.23).

- Calculate ψ_f from eq. (4.22)
- Calculate E from eq. (4.2)

(b4) Calculate second expression for front radius (r_f) from eq. (4.4).

(b5) The iteration routine:

The iteration search for correct θ_e uses the Newton-Raphson routine.

The function:

$$F = r_{ff} - r_f = 0 \qquad (4.29)$$

r_{ff} is the expression from the formula (eq. 4.4) where r_f is the geometric expression (eq. 2.28).

The derivative is found with respect to θ_e:

$$F' = \frac{d(r_{ff})}{d(\theta_e)} - \frac{d(r_f)}{d(\theta_e)} \tag{4.30}$$

$$\frac{d(r_{ff})}{d(\theta_e)} = \pm \frac{(r_{ff})^3}{2E^2} \cdot B_1 \cdot \cos[\mp 2\theta_e + \sin^{-1}(B_2)] \tag{4.30.1}$$

Where:

$$B_1 = \sqrt{A^2 + 4B(E/r_r)^2} \tag{4.30.2}$$

$$B_2 = [2(E/r_r)^2 - A]/B_1 \tag{4.30.3}$$

The lower signs are used when the front radius (r_f) is calculated from a known rear radius (r_r) (this case occurs at $J > 1$), while the upper signs are used when r_r is calculated from r_f (for $J=1$).

$$\frac{d(r_f)}{d(\theta_e)} = \frac{-X_C \cdot \tan\alpha \cdot \{\cos[\theta_0(J) + \theta_e(J)] + \tan\alpha \cdot \sin[\theta_0(J) + \theta_e(J)}{\{\sin[\theta_0(J) + \theta_e(J)] - \tan\alpha \cdot \cos[\theta_0(J) + \theta_e(J)]\}^2} \tag{4.30.4}$$

(c) Correct Solution

After knowing the correct value for $\theta_e(J)$, the procedure used in (b) can be followed resulting in the correct values for:
$I_1(J)$, δ, $X_1(J)$, $Y_1(J)$, $r_f(J)$, $I_1'(J)$, $\psi_f(J)$, E. Using equation (4.2.2) ψ_r can be calculated. Equations (4.15), (4.16),(4.17) can be solved for $\eta(J)$, $I_2'(J)$, $\beta(J)$ as shown previously for the J=1 case (equations 4.18, 4.15, 4.16).

4.3 Skew Rays

4.3.1 Front Surface

As in the homogeneous sace, the intercept point at the front surface (XO, YO, ZO) can be found (equations 3.19.1, 3.19.2, 3.19.3).

Also, the direction cosines of the normal to the front surface can be calculated (equations 3.22,3.23). The direction cosines of the ray can be found as well using equation (3.26).

4.3.2 Front Radius

Knowing the intercept point at the front surface, the front radius can be calculated:

$$r_f(J) = [(XO - X_C)^2 + (YO)^2 + (ZO)^2]^{\frac{1}{2}} \qquad (4.31)$$

Knowing $r_f(J)$, the initial index of refraction $[n_2(r_f)]$ can be calculated using equation (4.3).

4.3.3 Refraction at the Front Surface

As for the homogeneous case (section 3.2.4), the refracted angle at the front surface can be calculated using equations (3.30), (3.31).

4.3.4 Initial Direction Cosines for the Internal Refracted Ray

The initial direction cosines of the internal refracted ray (K',L',M') are calculated the same way as for the homogeneous case (section 3.2.5, equation 3.32). The vector form of the initial direction of the ray is therefore:

$$\vec{R} = K' \cdot \hat{e}_X + L' \cdot \hat{e}_Y + M' \cdot \hat{e}_Z \qquad (4.32)$$

4.3.5 Front Radius Direction Cosines

The vector form of the front radius is defined as follows:

$$\vec{r}_f = r_{fX} \cdot \hat{e}_X + r_{fY} \cdot \hat{e}_Y + r_{fZ} \cdot \hat{e}_Z \tag{4.33}$$

Where the direction cosines are:

$$\left.\begin{aligned} r_{fX} &= (XO - X_C)/r_f(J) \\ r_{fY} &= YO/r_f(J) \\ r_{fZ} &= ZO/r_f(J) \end{aligned}\right\} \tag{4.33.1}$$

4.3.6 Normal to Plane of the Curved Ray at (XO,YO,ZO)

The vector cross product of $\vec{r}_f$ and $\vec{R}$ is normal to the plane defined by the two vectors.

$$\vec{NP}_f = \vec{r}_f \times \vec{R} = \begin{vmatrix} \hat{e}_X & \hat{e}_Y & \hat{e}_X \\ r_{fX} & r_{fY} & r_{fZ} \\ K' & L' & M' \end{vmatrix} \tag{4.34}$$

$$\vec{NP}_f = NP_{fX} \cdot \hat{e}_X + NP_{fY} \cdot \hat{e}_Y + NP_{fZ} \cdot \hat{e}_Z \tag{4.34.1}$$

Where:

$$\left.\begin{aligned} NP_{fX} &= r_{fY} \cdot M' - r_{fZ} \cdot L' \\ NP_{fY} &= r_{fZ} \cdot K' - r_{fX} \cdot M' \\ NP_{fZ} &= r_{fX} \cdot L' - r_{fY} \cdot K' \end{aligned}\right\} \tag{4.34.2}$$

and

$$NP_f = \sqrt{NP_{fX}^2 + NP_{fY}^2 + NP_{fZ}^2} \tag{4.34.3}$$

The normalized direction cosines of the normal to the plane of the curved ray at (XO,YO,ZO) are therefore:

$$NP_{fX}/NP_f \quad ; \quad NP_{fY}/NP_f \quad ; \quad NP_{fZ}/NP_f \tag{4.34.4}$$

4.3.7 Calculating the Angle Between the Ray and the Front Radius

$$\vec{r}_f \cdot \vec{R} = |\vec{r}_f| \cdot |\vec{R}| \cdot \cos(\psi_f) \qquad (4.35)$$

Both the ray and the unit vector for the front surface radius are normalized, i.e.

$$\left.\begin{aligned} |\vec{r}_f| &= (r_{fX}^2 + r_{fY}^2 + r_{fZ}^2)^{\frac{1}{2}} = 1 \\ |\vec{R}| &= (K'^2 + L'^2 + M'^2)^{\frac{1}{2}} = 1 \end{aligned}\right\} \qquad (4.35.1)$$

Therefore:

$$\psi_f = \cos^{-1}[\vec{r}_f \cdot \vec{R}]$$

$$= \cos^{-1}[r_{fX} \cdot K' + r_{fY} \cdot L' + r_{fZ} \cdot M'] \qquad (4.35.2)$$

4.3.8 Calculating constant E

Knowing ψ_f, constant E can be calculated using equation (4.2).

4.3.9 Intercept Point of the Curved Ray with Rear Surface (Point XI,YI,ZI)

4.3.9.1 Equations

As previously, θ_e is the angle between the front radius and the rear radius.

$$r_{rX} \cdot r_{fX} + r_{rY} \cdot r_{fY} + r_{rZ} \cdot r_{fZ} = \cos[\theta_e(J)] \qquad (4.36)$$

The direction cosines of the front radius were calculated in equation (4.33). Similiarly, the direction cosines of the rear radius are:

$$\left.\begin{aligned} r_{rX} &= (XI - X_C / r_r(J) \\ r_{rY} &= YI/r_r(J) \\ r_{rZ} &= ZI/r_r(J) \end{aligned}\right\} \qquad (4.36.1)$$

Therefore, equation (4.36) can have the form:

$$(XI - X_C)r_{fX} + (YI)r_{fY} + (ZI)r_{fZ} = r_r(J) \cdot \cos[\theta_e(J)] \qquad (4.36.2)$$

The rear radius is defined as:

$$(XI - X_C)^2 + (YI)^2 + (ZI)^2 = [r_r(J)]^2 \qquad (4.37)$$

The rear surface was defined previously. Consequently:

$$-(aXI - b)^2 + (YI)^2 + (ZI)^2 = 0 \qquad (3.33)$$

a,b were defined by equations 3.33.1 and 3.33.2.

Also, from geometry:

$$(XI - X_C) = r_r(J) \cdot \cos[\theta_0(J)] \qquad (4.38)$$

Another equation arrives from the connection between the two radii through eq. (4.4).

4.3.9.2 Solution

a. Assume $\theta_e(J)$.

b. Calculate $r_r(J)$ from the formula (equation 4.4).

c. Calculate XI from equation (4.36.2):

$$XI = r_r(J) \cdot \cos[\theta_0(J)] + X_C \qquad (4.36.3)$$

d. Calculate radius from equations

(4.37) and (4.36.3):

$$\text{Radius} = R = [(YI)^2 + (ZI)^2]^{\frac{1}{2}}$$
$$= r_r(J)[1 - \cos^2[\theta_0(J)]]$$
$$= r_r(J) \cdot \sin[\theta_0(J)] \qquad (4.37.1)$$

e. Calculate parameters a and b from equations (3.33.1) and (3.33.2) as in the homogeneous case.

f. Substituting into equation (3.33):

$$XI = (R + b)/a = \{r_r(J) \cdot \sin[\theta_0(J)] + b\}/a \qquad (4.38)$$

where R is the radius defined in equation (4.37.1).

g. Solving equations (4.36.3), (4.38) for $\theta_0(J)$ one gets:

$$\theta_0(J) = \sin^{-1}\left[-\frac{B'}{A'} + \frac{\sqrt{(B')^2 - (A')(C')}}{A'}\right] \qquad (4.39)$$

Where:

$$\left.\begin{aligned} A' &= [r_r(J)]^2(1 + a^2) \\ B' &= [r_r(J)](b - a \cdot X_C) \\ C' &= (b - a \cdot X_C)^2 - a^2 \cdot [r_r(J)]^2 \end{aligned}\right\} \qquad (4.40)$$

h. Knowing $\theta_0(J)$, it is possible to calculate new value for $\theta_e(J)$ and iterate through steps (a) - (g) until the difference in the values of $\theta_0(J)$ is

small enough.

i. When an accurate value of $\theta_0(J)$ is received, XI is calculated from equation (4.36.3). YI and ZI are calculated using equations (4.36) and (4.37.1). Consequently:

$$\left.\begin{aligned} YI &= \frac{B''}{A''} + \frac{\sqrt{(B'')^2 - (A'')(C'')}}{A''} \\ ZI &= \sqrt{\{r_r(J) \cdot \sin[\theta_0(J)]\}^2 - \{YI\}^2} \end{aligned}\right\} \qquad (4.41)$$

Where:

$$A'' = 1 + [r_{fY}]^2/[r_{fZ}]^2$$

$$B'' = \{r_r(J) \cdot \cos[\theta_e(J)] - (XI - X_C) r_{fX}\} r_{fY}/r_{fZ}$$

$$C'' = \left\{\frac{r_r(J)}{r_{fZ}} \cdot \cos[\theta_e(J)] - (XI - X_C)\frac{r_{fX}}{r_{fZ}}\right\}^2 - \left\{r_r(J) \cdot \sin[\theta_0(J)]\right\}^2 \qquad (4.42)$$

When $r_{fZ} = 0$, the solution for YI and ZI is different:

$$YI = \{r_r(J) \cdot \cos[\theta_e(J)] - (XI - X_C) r_{fX}\}/r_{fY} \qquad (4.43)$$

While ZI is calculated by equation (4.41).

4.3.10 Direction Cosines of the Ray at the Rear Surface

a. Similarly to what was done at the front surface (equation 4.35):

$$\vec{r}_r \cdot \vec{R} = |\vec{r}_r| \cdot |\vec{R}| \cdot \cos(\psi_r) \qquad (4.44)$$

Both the ray and the rear radius are normalized; therefore:

$$r_{rX} \cdot K_r' + r_{rY} \cdot L_r' + r_{rZ} \cdot M_r' = \cos\psi_r \qquad (4.44.1)$$

b. The ray remains within the same plane while transfering from the front surface to the rear surface. i.e.:

$$NP_{fX} \cdot K_r' + NP_{fY} \cdot L_r' + NP_{fZ} \cdot M_r' = \cos(\pi/2) = 0 \qquad (4.45)$$

c. The direction cosines of the ray are normalized, i.e.

$$(K_r')^2 + (L_r')^2 + (M_r')^2 = 1 \qquad (4.46)$$

d. Solution:

(d1) $NP_{fX} \neq 0,\ NP_{fY} \neq 0,\ NP_{fZ} \neq 0$

$$\left.\begin{aligned} (L'_r) &= \frac{B''}{2A''} \pm \frac{\sqrt{(B'')^2 - 4(A'')(C'')}}{2A''} \\ (M'_r) &= \frac{C}{B} - \frac{A}{B}(L'_r) \\ (K'_r) &= [-NP_{fY} \cdot (L'_r) - NP_{fZ} \cdot (M'_r)]/NP_{fX} \end{aligned}\right\} \qquad (4.47)$$

Where:

$$\left.\begin{aligned} A &= NP_{fX} \cdot r_{rY} - NP_{fY} \cdot r_{rX} \\ B &= NP_{fX} \cdot r_{rZ} - NP_{fZ} \cdot r_{rX} \\ C &= NP_{fX} \cdot \cos(\psi_r) \\ A' &= \left(\frac{NP_{fY}}{NP_{fX}}\right)^2 + 1 \\ B' &= \left(\frac{NP_{fZ}}{NP_{fX}}\right)^2 + 1 \\ C' &= \frac{2(NP_{fY})(NP_{fZ})}{(NP_{fX})^2} \end{aligned}\right\} \qquad (4.48)$$

$$\left.\begin{aligned} A'' &= (A') + (B')\left(\frac{A}{B}\right)^2 - \frac{(C')(A)}{(B)} \\ B'' &= \frac{2(A)(C)(B')}{(B)^2} - \frac{(C')(C)}{(B)} \\ C'' &= (B')\left(\frac{C}{B}\right)^2 - 1 \end{aligned}\right\} \qquad (4.48)$$

In (4.47) the (+) sign is used when $r_{rY} < 0$ while the (-) sign is used when $r_{rY} \geq 0$.

(d2) In the above case, when $\underline{B = 0}$ (look for definition of B in equation (4.48)) the solution for direction cosines of the ray is different.

$$\left.\begin{aligned} (L'_r) &= \frac{C}{A} \\ (M'_r) &= -\frac{(C')(L'_r)}{2(B')} \pm \frac{\sqrt{\left[\frac{(C')(L'_r)}{2}\right]^2 - (B')[(A')(L'_r)^2 - 1]}}{B'} \\ (K'_r) &= [-NP_{fY} \cdot (L'_r) - NP_{fZ} \cdot (M'_r)]/NP_{fX} \end{aligned}\right\} \qquad (4.49)$$

All the symbols used here were defined in equation (4.48) and the ± sign is used as before.

(d3) $\underline{NP_{fX} = 0,\ NP_{fY} = 0,\ NP_{fZ} \neq 0,\ r_{rY} \neq 0}$

$$(M'_r) = 0 \qquad (4.50)$$

$$\left.\begin{aligned} (K'_r) &= \frac{B''}{A''} \pm \frac{\sqrt{(B'')^2 - (A'')(C'')}}{A''} \\ (L'_r) &= \frac{1}{r_{rY}} [\cos(\psi_r) - r_{rX} \cdot K'_r] \end{aligned}\right\} \qquad (4.50)$$

The (+) sign is used here.

While in this case:

$$\left.\begin{aligned} A'' &= 1 + \left(\frac{r_{rX}}{r_{rY}}\right)^2 \\ B'' &= \cos(\psi_r) \frac{r_{rX}}{(r_{rY})^2} \\ C'' &= \left[\frac{\cos(\psi_r)}{r_{rY}}\right]^2 - 1 \end{aligned}\right\} \qquad (4.51)$$

(d4) In the above case, when $r_{rY} = 0$ the solution is:

$$\left.\begin{aligned} (M'_r) &= 0 \\ (K'_r) &= \frac{\cos(\psi_r)}{r_{rX}} \\ (L'_r) &= \pm\sqrt{1 - (K'_r)^2} \end{aligned}\right\} \qquad (4.52)$$

Again, the (+) sign is used here.

(d5) $NP_{fX} = 0$, $NP_{fY} \neq 0$, $NP_{fZ} = 0$, $r_{rZ} \neq 0$

The solution is similar to that in case (d3).

$$\left.\begin{aligned} (L'_r) &= 0 \\ (K'_r) &= \frac{B''}{A''} \pm \frac{\sqrt{(B'')^2 - (A'')(C'')}}{(A'')} \\ (M'_r) &= \frac{1}{r_{rZ}} [\cos(\psi_r) - r_{rX} \cdot K'_r] \end{aligned}\right\} \qquad (4.53)$$

(A"), (B"), (C") are the same as defined in (4.51) except that r_{rY} is replaced everywhere by r_{rZ}. The (+) sign is used here.

(d6) In the above case, when $r_{rZ} = 0$ the solution is similar to that in case (d4):

$$\left.\begin{aligned} (L'_r) &= 0 \\ (K'_r) &= \frac{\cos(\psi_r)}{r_{rX}} \\ (M'_r) &= \pm\sqrt{1 - (K'_r)^2} \end{aligned}\right\} \qquad (4.54)$$

Also here, the (+) sign is used.

(d7) $NP_{fX} = 0$, $NP_{fY} \neq 0$, $NP_{fZ} \neq 0$, $r_{rX} = 0$

$$\left.\begin{aligned} (L'_r) &= \frac{\cos(\psi_r)}{r_{rY} - \frac{NP_{fY}}{NP_{fZ}} \cdot r_{rZ}} \\ (M'_r) &= -\frac{NP_{fY}}{NP_{fZ}} (L'_r) \\ (K'_r) &= \pm\sqrt{1 - (L'_r)^2 - (M'_r)^2} \end{aligned}\right\} \qquad (4.55)$$

The (+) sign is used here.

(d8) As in (d7), but: $(r_{rY} - \frac{NP_{fY}}{NP_{fZ}} \cdot r_{rZ}) = 0$;

$r_{rX} \neq 0$

$$\left.\begin{aligned} (K'_r) &= \frac{\cos(\psi_r)}{r_{rX}} \\ (L'_r) &= \pm \sqrt{\frac{1 - (K'_r)^2}{1 + \left(\frac{NP_{fY}}{NP_{fZ}}\right)^2}} \\ (M'_r) &= - \frac{NP_{fY}}{NP_{fZ}} (L'_r) \end{aligned}\right\} \qquad (4.56)$$

(d9) As in (d7), but: $r_{rX} \neq 0$

$$\left.\begin{aligned} (L'_r) &= \frac{(B")}{2(A")} \pm \frac{\sqrt{(B")^2 - 4(A")(C")}}{2(A")} \\ (M'_r) &= - \frac{NP_{fY}}{NP_{fZ}} (L'_r) \\ (K'_r) &= \frac{1}{r_{rX}} \left[\cos(\psi_r) - (r_{rY} - \frac{NP_{fY}}{NP_{fZ}} r_{rZ})(L'_r)\right] \end{aligned}\right\} \qquad (4.57)$$

As in case (d1), the (+) sign is used when: $r_{rY} < 0$ while the (-) sign is used when: $r_{rY} \geq 0$.

5. FLOW CHART OF PROGRAM LENS

(Homogeneous Case)

Note: Subroutines SHAPET, SKEWT compute the shape of lens and the skew rays as described in the previous sections (3,4). However, subroutines SHAPEC, SKEWC compute the shape and the skew rays of a different design of the lens. In this design, the fixed cone is the rear surface instead of the front surface (compare figure 9 to figure 2.). The equations for this different design are not included in the current report. The equations are part of Capt. Carr's thesis [15] and will be described there.

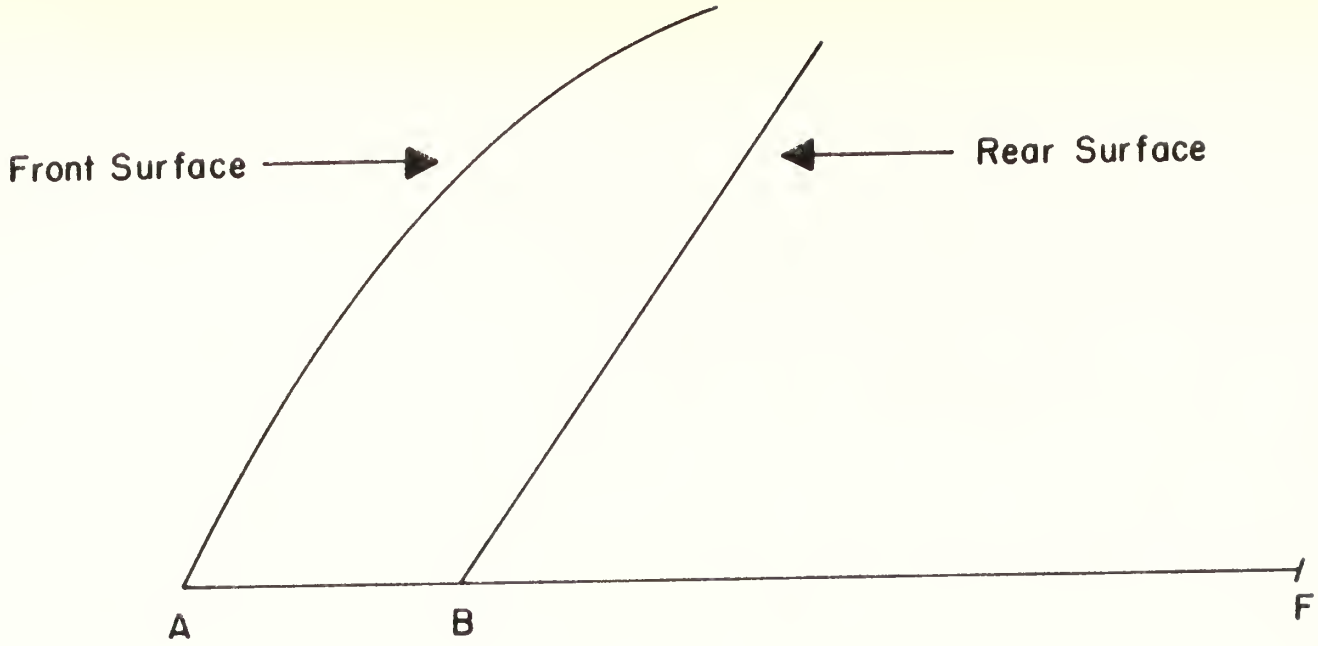

Figure 9. Illustration of the lens which has a circular cone on the inside surface.

7. COMPUTER PROGRAMS USER'S GUIDE

7.1 Input Data

F, α, U, I_{case}

I, R, T(1)

N_1, N_2, N_3

α_p, Grid, Ellnum

X_C, Div

Shape, Squray, Ellips

7.2 Options

I_{case}=1 Rear surface is a fixed cone
(Capt. Carr's thesis, see ref. [15])

I_{case}=2 Front surface is a fixed cone
(This report).

7.3 Execution Commands

7.3.1 Opening Commands

LΔXXXX (Write account no. instead of XXXX).

Password

GLOBAL TXTLIB FORTMOD2 MOD2EEH

7.3.2 Compilation

FORTGI LENS (or GRIN)

7.3.3 Run on Terminal (WORKG(1))

FILEDEF 05 DISK DATA L

FILEDEF 06 DISK OUT D (RECFM F BLOCK 132 PERM

EXEC RUN LENS (or GRIN)

XEDIT OUT D

7.3.4 Hard Copy

FILE

PRINT OUT D

7.3.5 Get a Plot

LENSCOM PRINTER

7.3.6 Change in Plot Routine

XEDIT LENSPLOT FORTRAN

7.3.7 Transfer Files to Another User

(a) **The Transferer**

CP SPOOL PUNCH CONT TO XXXXP(2)

PUNCH LENS FORTRAN(3)

(PUNCH GRIN FORTRAN(3))

(PUNCH DATA L(3))

CP SPOOL PUNCH CLOSE NOCONT

CP SPOOL PUNCH OFF

(b) The Receiver

READCARDΔ*Δ*

(c) Notes

(1) WORKG is the name of the file of the commands in this section.

(2) Account No. of the receiver.

(3) Optional.

8. COMPUTER PROGRAMS LIST OF SYMBOLS AND SUBROUTINES

8.1 Subroutines

DATTA — Initial data

SHAPET — Computes shape of lens in $I_{case}=2$

SHAPEC — Computes shape of lens in $I_{case}=1$

INIT — Computes behavior of first ray.

POINTS — Computes coordinates of rear and front surfaces.

FRONT — Computes $I_1(J)$, $I_1'(J)$, ψ, E at front surface.

REAR — Computes $\eta(J)$, $I_2(J)$, $I_2'(J)$ at rear surface.

CALTC — Computes thickness at each point for SHAPEC.

NOSE — Computes extrapolation of last points in $I_{case}=1$, or coordinates shift in $I_{case}=2$.

ZOYO — Computes $Z_0'(IZ)$, $y_0'(IZ)$ for skew rays calculation.

RADI — Computes intersection of the ray with the designed surface.

SKEWT — Skew rays calculation in $I_{case}=2$.

SKEWC — Skew rays calculation in $I_{case}=1$.

INTENS — Calculates transmitted intensity of the rays.

IMAGE — Calculates image plane spot diagram.

SUMM — Calculates spot diagram energy density.

PLOTT — Save output for plot routine.

INDEX — Computes index of refraction in the lens (N_2).

RADN2 — Computes radius to rear (or front) surface from known radius to front (or rear) surface and θ_e.

ITER — Iteration routine to find correct θ_e in SHAPET.

DIRECT — Computes direction cosines of the ray at the rear surface.

8.2 Program Symbols

8.2.1 Data Symbols

F	Focal length.
α	The fixed surface cone half angle.
U	The incident ray offset angle.
I	Number of iterations.
R	Maximum radius of fixed surface cone.
T(1)	Thickness of lens at the edge.
N_1, N_2, N_3	Indices of refraction.
α_p	Inclination of object plane.
Grid	Size of grid increment.
Ellnum	Number of ellipses.
Ell	z - coordinate increment for ellipse plot.
X_C	Location of center symmetry in GRIN.
Div	The maximum change in the index of refraction (N_2)

8.2.2 Geometrical Symbols

$x_1(J), y_1(J)$	Coordinates on front surface.
$x_2(J), y_2(J)$	Coordinates on rear surface.
$r_f(J)$	Radius to front surface.
$r_r(J)$	Radius to rear surface.
XO, YO, ZO	Intercept of the ray with the front surface.
XI, YI, ZI	Intercept of the ray with the rear surface.
Y_{Im}, Z_{Im}	Intersection with the image plane.

8.2.3 Direction Cosines Symbols

N_x, N_y, N_z	Direction cosines of the front surface normal.

N_{xI}, N_{yI}, N_{zI}	Direction cosines of the rear surface normal.
R_x, R_y, R_z	Direction of cosines of the ray.
K', L', M'	Direction cosines of the internal refracted ray.
r_{fx}, r_{fy}, r_{fz}	Direction cosines of the front radius.
$NP_{fx}, NP_{fy}, NP_{fz}$	Direction cosines of the normal to plane of the ray at front surface.
r_{rx}, r_{ry}, r_{rz}	Direction cosines of the rear radius.
K", L", M"	Direction cosines of the rear surface external refracted ray.

8.2.4 Angle Symbols

The angle symbols are defined in figures 3 and 8.

11. PRELIMINARY RESULTS

Table 1. Comparison of RMS Spot size for a homogeneous lens with the RMS Spot size for a GRIN lens.

α_p \ DIV	0	+0.05	-0.05
0.	0.0057336	0.0069021	0.005286
0.1	0.027424	0.027646	0.027327
0.2	0.06277	0.06288	0.06304
0.3	0.113431	0.11216	0.113245
0.4	0.18265	0.18287	0.18277

Note: DIV is the fractional variation of refractive index. α_p is the angle of incoming parallel rays relative to lens axis; α_p has dimensions of radians. The center of symmetry X_c was at -0.07 measured from the apex of the outer surface. The minus sign indicates that X_c is external to lens.

SPOT DIAGRAM CALCULATIONS COMPLETE.
TO OBTAIN PLOTS FROM THE PLOTTER OR THE PRINTER,
ISSUE THE FOLLOWING COMMAND:
FOR PRINTER PLOTS ENTER "LENSCOM PRINTER"
FOR PLOTTER GRAPHS ENTER "LENSCOM PLOTTER"
END OF PROGRAM

RESULTS FROM GRIN

2. Input: $X_C = -0.07$, DIV = -0.05, $\alpha_p = 0.0$

GRIN PARAMETERS(2):

ALPHA = 0.7853979 BETA = 0.3227880 RADIUS = 1.00000 INCIDENT ANGLE = 0.0 ITERATIONS = 100

EDGE THICKNESS = 0.0500000 INDICES OF REFRACTION: N1 = 1.00000 N2 = 1.42157 N3 = 1.00000

FOCAL LENGTH FROM STATION ZERO = 4.00000 DELTA BETA= 0.00032

CENTER OF SYM(XC)=-0.07000 CHANGE IN N2(E)=-0.050 ALPAP= 0.0

NOTE:X-COORDINATES HAS BEEN SHIFTED IN CASE=2 BY X2(K);NOW,X2(K)=0.0 ETC.

ISSUE THE FOLLOWING COMMAND:
        FOR PRINTER PLOTS          ENTER "LENSCOM PRINTER"
        FOR PLOTTER GRAPHS         ENTER "LENSCOM PLOTTER"
END OF PROGRAM
```

12. SUMMARY OF THE REPORT

Lens design and ray tracing to determine optical aberrations requires efficient computer codes. A clearly structured computer code with efficient algorithms has been developed to design a lens incorporating gradient refractive index, GRIN. One surface of the lens, either the inside or outside surface, is a circular cone.

The computer code includes lens design and calculation of optical aberration for a lens using a homogeneous material, i.e., for n equal to a constant. The homogeneous case is included for several reasons. The simpler case with n equal to a constant provides insight to the more complex case of variable n. Extensive computer codes require a check on the validity of the output. The homogeneous case provides a check. When the factor B is equal to zero in equation [2.9], the results for the two computer programs with and without GRIN should be identical. Needless to say, the results are identical for the programs reported here.

The case of a lens with GRIN and with a circular cone for the outside surface has been programmed. The companion case with the circular cone on the inside is being developed by Carr [15]. Carr's program can be readily incorporated into this computer code.

The program has been exercised for the case of 5% variation in refractive index for both negative and positive

values for B. The aim of the preliminary calculations was to verify operation of the computer program. More extensive calculations are required in order to understand the influence of various variables. As more experience is gained, the program should be combined with an optimization code to permit thorough and efficient lens design.

The selection of a 5% variation in refractive index was based on current state-of-the-art in the production of GRIN materials. A wider variation in refractive index may be needed.

The program is restricted currently to values of X_c satisfying the constraint $X_c \leq 0$. Additional work is needed to permit designs using positive values of X_c. When X_c is positive, the angle θ at some point along the ray interior to the lens has a critical value at which $dr/d\theta$ changes sign. The critical value causes computational difficulties.
